

Ethara AI – Software Engineer **(LLM Post-Training & AI Data Operations)**

Ethara AI is a research-first AI lab committed to shaping the future of AGI, with the ambition to become the world's most trusted partner — from India, for the world.

We specialize in building high-quality, domain-specific datasets for Large Language Models (LLMs) through:

- **RLHF (Reinforcement Learning from Human Feedback):** Aligning models with human preferences for helpful, accurate, and safe outputs
- **SFT (Supervised Fine-Tuning):** Creating domain-specific instruction datasets to guide model behavior
- **Evaluations:** Designing rubric-based frameworks to assess quality, fairness, and model safety

Our work directly contributes to frontier model training, supported by a managed AI workforce and a research-first approach grounded in benchmarking and continuous improvement.

We are hiring **Full-Stack Software Engineers** to contribute to **LLM post-training workflows and AI data operations**, combining **analytical problem-solving with engineering fundamentals**.

Role Details

- **Position:** Software Engineer
- **Employment Type:** Full-Time
- **Compensation:** ₹6,00,000 per annum (CTC)
- **Shift Structure:** Rotational
 - Day Shift (WFO, Gurgaon)
 - Night Shift (WFH)
 - **Shift allocation will be based on business requirements and is mandatory for all selected candidates**

Work Setup

- Work on own laptop (stable internet; browser-based tools for remote shifts)
- Collaborate with Quality Leads & AI Ops teams
- Mandatory participation in training, calibration, and review sessions

Role Objective

- Work on generalist LLM post-training projects
- Tasks include: data annotation, labeling & categorization; prompt-response evaluation (accuracy, relevance, coherence); data validation & quality checks
- Apply structured thinking and engineering fundamentals to ensure high-quality outputs
- Continuous guidance and performance-based feedback from Quality Reviewers

Technical Exposure

- Annotation & evaluation platforms used in AI pipelines
- LLM behavior, prompt design basics, and evaluation criteria
- Structured/unstructured data handling (text, tabular, simple schemas)
- Logical reasoning, pattern recognition, and quality benchmarking (accuracy, consistency, guideline adherence)

Technical Requirements

- Strong foundation in software engineering / full-stack fundamentals (any modern stack)
- Understanding of APIs, databases, and structured data
- Good problem-solving and analytical skills
- Familiarity with version control (e.g., Git)

Expectations

- Flexibility for rotational shifts (day/night) based on business requirements
- Openness to extended hours/weekend work if required
- Maintain high accuracy and adherence to SLAs/KPIs in a fast-paced, metrics-driven environment
- Exposure to AI workflows, data operations, and model evaluation

Selection Process (Mandatory)

Apply here: [Full-Stack Assessment<>Ethara.AI](#)

- Complete the application form
- Submit the **Full-Stack Assignment** and provide an **executable/live project link**
- Upload updated resume

Shortlisted candidates will go through:

1. **Technical Assessment Round**
2. **Personal Interview (PI)**

This role enables candidates to **work on live AI projects, strengthen analytical and data-handling skills, and understand how modern AI systems are evaluated and improved in production environments**, while applying their software engineering fundamentals in real-world workflows.
